Maxthon browser compatible with Pioneer AppRadio™

Maxthon, a software company that develops web browsers, announced compatibility with Pioneer's AppRadio™ platform. The Pioneer technology uses the smartphone's processing power to access and control compatible apps directly on the touchscreen of Pioneer's AppRadio, in-dash multimedia and navigation receivers. With AppRadio users can access their phone's calendar, maps, photos and more than two dozen compatible apps directly on the car stereo's touchscreen. Users can download Pioneer's free AppRadio application onto a compatible iPhone® or Android™ device and connect to an AppRadio™ platform receiver using the appropriate interface cable.

"Maxthon further enhances the power of AppRadio by integrating our cloud-powered browser with the innovative features of Pioneer's advanced platform," said Jeff Chen, CEO of Maxthon. "AppRadio is also further proof of our commitment to the post-PC era, where there is seamless exchange of information between devices. With the AppRadio, smartphone users can maximize its processing power, storage capacity and network connectivity with speed and simplicity."
